Storm Data and Unusual Weather Phenomena - April 2024

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
	04/01/24 21:44 CST		0	Hail (0.75 in)
	04/01/24 21:44 CST		0	Source: Public
MPing report.				
A strong (90-100 knot) mid-level speed maximum, embedded within a broader longwave trough (at 500 mb), approached portions of the area during the afternoon into the evening on the 1st. As strong synoptic ascent overspread a boundary layer characterized by seasonable moisture (ahead of an approaching cold front), multiple rounds of convection developed and impacted portions of the WFO Norman Forecast Area. Despite strong instability and organizing wind shear, early-day clouds and areas of precipitation hampered destabilization in the boundary layer. This facilitated a predominately 'elevated' character of convection, with a few instances of large hail resulting from the strongest storms. The approaching cold front also acted to "undercut" established storms in its vicinity, limiting concern for tornadic outcomes (despite increasing low-level shear towards dusk).

CLEVELAND COUNTY --- 1.4 SSW (OUN)NORMAN WESTHEIMER ARPT [35.23, -97.48]				
	04/06/24 16:50 CST		0	Thunderstorm Wind (EG 52 kt)
	04/06/24 16:50 CST		0	Source: Broadcast Media
Large tree limb blown down. Time is radar estimated.				
A vigorous shortwave trough quickly moved into portions of the Central/Southern Plains during the day on the 6th. Hazardous weather occurred on both sides of an advancing Pacific front/dryline during the afternoon and evening hours. Behind the boundary, a strong low-level jet/flow was juxtaposed atop a very dry airmass, resulting in dangerous fire weather conditions. Two large wildfires ignited during the early evening across portions of northwest Oklahoma. In the moist sector, widely scattered thunderstorm development occurred during the late afternoon. Despite strong deep-layer wind shear (as expected with a strong upper wave), limited instability proved hostile for sustained severe convection/outcomes. A transient supercell thunderstorm moved across southern portions of the Oklahoma City metro area, producing isolated wind damage.				
BRYAN COUNTY --- 2.3 SE CARTWRIGHT [33.83, -96.53]				
	04/08/24 21:20 CST		0	Hail (1.00 in)
	04/08/24 21:20 CST		0	Source: Public
MPing report.				
LOVE COUNTY --- 2.5 ESE MARIETTA [33.93, -97.08]				
	04/08/24 22:00 CST		0	Hail (1.75 in)
	04/08/24 22:00 CST		0	Source: Emergency Manager
Relayed images. Time is radar estimated.				
Broad southwesterly mid-level flow prevailed across the Southern Plains on the 8th. Widespread thunderstorm development occurred in the vicinity of a quasi-stationary boundary across west-central into north-central Texas during the evening hours. A few storms encroached on far southern portions of the WFO Norman Forecast Area, with a few instances of large hail and a downburst wind event occurring across portions of the Red River Valley.				
TILLMAN COUNTY --- DAVIDSON [34.24, -99.08]				
	04/09/24 20:09 CST		0	Hail (1.00 in)

Social media video. Most hailstones were smaller than listed magnitude. Time is radar estimated.

A round of prolonged and widespread convection occurred across portions of western-north Texas into far southwest Oklahoma on the 9th. Early in the morning, semi-organized clusters of thunderstorms slid across portions of western-north Texas, producing reports/measured gusts of severe wind. Renewed convective development occurred later in the day, beneath the cold upper low, producing additional severe-caliber wind gusts/damage and a few reports of hail from the Red River into south-central Oklahoma.

	04/16/24 01:00 CST		0	Thunderstorm Wind (MG 50 kt)
	04/16/24 01:00 CST		0	Source: Mesonet

May Ranch (MAYR) Mesonet observation.

A strong synoptic wave approached the region during the evening into overnight hours on the 15th. An initial round of convection (during the afternoon of the 15th) preceded the more prominent mid/upper trough. This activity was driven in part by warm-air advection processes and synoptic support from a phasing branch on the subtropical jet. Sufficient instability and organizing wind shear promoted organized (supercell) thunderstorms with a threat of large hail. Through the evening, despite continued strong wind shear and approaching (increasing) synoptic ascent, a prominent layer of warm air aloft ('cap') prevented robust storm development through sunset. Scattered convection did ultimately develop by the very late evening on the 15th. However, outside of a severe-caliber wind gust along the Oklahoma/Kansas border area, severe weather outcomes were limited until convection moved north of the WFO Norman area (into south-central Kansas).

	04/26/24 03:45 CST		0	Thunderstorm Wind (EG 52 kt)
	04/26/24 03:45 CST		0	Source: Public

Social media image showing multiple large (6+ inches in diameter) tree limbs blown down. Time is radar estimated.

CLEVELAND COUNTY --- 2.1 ESE STELLA [35.31, -97.18], 2.3 ESE STELLA [35.31, -97.17]				
	04/26/24 03:49 CST		10K	Tornado (EF0, L: 0.54 mi , W: 30 yd)
	04/26/24 03:50 CST		0	Source: NWS Storm Survey

A tornado developed from a QLCS (Quasi-Linear Convective System) in northeast Cleveland County to the east-southeast of Stella. One mobile home had roof damage and trees were damaged along the path.

CLEVELAND COUNTY --- 2.6 ENE LAKE THUNDERBIRD DAM [35.23, -97.18]				
	04/26/24 03:50 CST		2K	Thunderstorm Wind (EG 52 kt)
	04/26/24 03:50 CST		0	Source: NWS Employee

Powerline down near the intersection of Oklahoma Highway 9 and Dobbs Road. Time is radar estimated.

POTTAWATOMIE COUNTY --- 5.2 NNW PINK [35.33, -97.14], 4.6 WSW DALE [35.36, -97.13]				
	04/26/24 03:52 CST		5K	Tornado (EF0, L: 2.40 mi , W: 40 yd)
	04/26/24 03:55 CST		0	Source: NWS Storm Survey

Two nearly-simultaneous tornadoes occurred in northwestern Pottawatomie County from a QLCS storm. The first one developed just east of the Cleveland-Pottawatomie County line along Lake Road and moved northeast and then north dissipating or merging with a second tornado near Fishmarket Road and Oakridge Lane. Two barns had siding damage, but otherwise damage was primarily to trees along the path.

CLEVELAND COUNTY --- 4.4 ENE STELLA [35.35, -97.14]				
	04/26/24 03:53 CST		1K	Tornado (EF1, L: 0.05 mi , W: 30 yd)
	04/26/24 03:53 CST		0	Source: NWS Storm Survey

Two nearly-simultaneous tornadoes occurred in northwestern Pottawatomie County from a QLCS storm. The second tornado developed just inside Cleveland County before moving quickly into Pottawatomie County. Tree damage was observed at the county line as the tornado moved into Pottawatomie County, but the grove of trees in Cleveland County was not accessible to the survey team.

POTTAWATOMIE COUNTY --- 5.9 WSW DALE [35.35, -97.14], 4.0 WSW DALE [35.37, -97.12]				
	04/26/24 03:53 CST		5K	Tornado (EF1, L: 1.88 mi , W: 75 yd)
	04/26/24 03:56 CST		0	Source: NWS Storm Survey

Two nearly-simultaneous tornadoes occurred in northwestern Pottawatomie County from a QLCS storm. The second tornado developed just inside Cleveland County before moving quickly into Pottawatomie County. Trees were snapped and a house received damage to shingles along and just east of the county line in Pottawatomie County. The tornado moved generally northeast producing tree damage and it may have merged with the first tornado near Fishmarket Road and Oakridge Lane. The tornado continued northeast for a little over 0.5 miles continuing to produce tree damage until it dissipated east of Lakewood Circle.

Storm Data and Unusual Weather Phenomena - April 2024

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
POTTAWATOMIE COUNTY --- 0.3 ESE DALE [35.39, -97.05]	04/26/24 04:03 CST		10K	Thunderstorm Wind (EG 61 kt)

	04/26/24 15:18 CST		0	Hail (0.88 in)
	04/26/24 15:18 CST		0	Source: Trained Spotter
Relayed by emergency management.				
During the early morning of the 26th, ahead of a strong upper wave passage, a quasi-linear convective system (QLCS) developed across portions of central into eastern Oklahoma. Despite strong kinematics (wind shear) in place, the initial phase of the linear complex was rather benign (in terms of severe weather outcomes). However, as the complex overspread the Interstate 35 corridor, organization increased rapidly, including the development of several strong mesovortices. A cluster of weak tornadoes and wind damage occurred across portions of east-central Oklahoma, associated with these mesovortices. By the afternoon, while stronger synoptic support had lifted into portions of the Missouri Valley, strong convergence along a trailing boundary/pseudo-dryline promoted development of a few transient storms. A report of small hail was received with one of these storms across Seminole County.				
ROGER MILLS COUNTY --- 0.5 NE CHEYENNE [35.61, -99.66]				
	04/27/24 08:52 CST		0	Hail (0.75 in)

A house received significant roof damage from thunderstorm winds in far southern Carter County . This appeared to be associated with the Rear Flank Downdraft (RFD) of a supercell that later produced the Ardmore tornado .				
CARTER COUNTY --- 5.3 SW ARDMORE [34.11, -97.20], 3.1 S SPRINGER [34.27, -97.14]				
	04/27/24 20:42 CST		20M	Tornado (EF2, L: 11.30 mi , W: 400 yd)
	04/27/24 20:56 CST	19	0	Source: NWS Storm Survey
The Ardmore tornado initially developed about 5 miles southwest of Ardmore, and moved north-northeast towards Ardmore. Some homes near Gateway Road had most or all of their roofs removed. Tree damage was significant along this area .				
The tornado then continued north-northeast through the west side of Ardmore especially near Plainview Road . Many homes suffered significant roof damage. Ardmore emergency management reported that 52 homes were damaged with 17 of them a total loss. The tornado moved near a Best Buy distribution center on the northwest side of Ardmore blowing over numerous trailers .				
Continuing north-northeast, the tornado continued producing tree and power pole damage, and EF2 roof damage to another home near Lake Ardmore road . The tornado crossed Interstate 35 just east of Ardmore Club Lake and turned more northeast before dissipating near US Highway 77 north of Deer Creek Road.

The Sulphur tornado initially developed in the Chickasaw National Recreation Area to the southwest of Sulphur and produced tree damage as well as damage to one building in the northeast section of the park as the tornado approached Sulphur. The tornado moved into the southern part of Sulphur causing significant damage to a number of homes on Tishomingo Avenue adjacent to the Chickasaw NRA .				
The tornado moved northeast through downtown Sulphur destroying or causing extensive damage to numerous businesses and buildings downtown. Many people were trapped and one woman was killed when a building housing a sports lounge collapsed downtown on this Saturday night. Damage was rated EF3 to numerous buildings downtown, as well as to some homes and buildings in neighborhoods across northeast Sulphur as the tornado continues to move northeast through town.				
The tornado continued northeast out of Sulphur and damaged another home along Palmer Road in northeastern Murray County. Tree damage was also observed on the county line as the tornado moved from Murray County into Pontotoc County.

Storm Data and Unusual Weather Phenomena - April 2024

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
The Spaulding-Holdenville Tornado developed along County Road N369 in the south side of the town of Spaulding and moved north through Spaulding causing roof damage to a few homes and damaging some outbuildings, metal buildings and trees. The damage in and near Spaulding was primarily EF1 damage.				
The tornado became wider as it moved north-northeast from Spaulding becoming almost two-thirds of a mile wide as it crossed County Road E135 and a mile wide as it moved north of County Road E134. Most of the damage west of Holdenville was between Spaulding Road and County Road N369 missing the most populated part of Holdenville to the west and the missing the Davis Correctional Facility to the east. The tornado continued producing roof damage to homes as well as damage to outbuildings, metal buildings, trees and power poles.				
The tornado was still about one mile in width as it moved north-northeast crossing US Highway 270 and County Road E132, but the intensity increased from EF1 to EF3 as it approached County Road E131. Multiple mobile homes were completely destroyed in this area. Two fatalities occurred in mobile homes here where a 35 year old man was killed in one mobile home and a 4 month old girl was killed in another.				
Although the tornado moved through less densely populated areas of Hughes County continued moving north-northeast through less densely populated areas of Hughes County, it still produced significant roof damage to homes and destroyed mobile homes as it continued moving north-northeast, especially along State Highway 48 north of Holdenville, County Road E125 just east of State Highway 48, and E120 Road where EF2 damage was observed in each of these areas. The tornado then crossed E 119 Road into Okfuskee County. See the Eastern Oklahoma entry from NWS Tulsa for the continuation of this tornado.				
Direct Fatalities: M35MH, F0MH				

PONTOTOC COUNTY --- 4.5 SW ROFF [34.59, -96.90], 4.3 WSW ROFF [34.60, -96.90]

MURRAY COUNTY --- 4.5 E DOUGHERTY [34.39, -96.97], 5.6 SE SULPHUR [34.45, -96.91]

Storm Data and Unusual Weather Phenomena - April 2024

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
	04/27/24 22:07 CST		0.20M	Tornado (EF1, L: 5.90 mi , W: 250 yd)
	04/27/24 22:18 CST		0	Source: NWS Storm Survey

This tornado developed about 1 miles west-southwest of Drake, or about 4.5 miles east of Dougherty. It moved erratically northeast and crossed US Highway 77 about a mile and half north of Drake. Near US-77, it caused roof damage to one home and blew out windows in another. Some metal buildings were also damaged in this area. Otherwise the damage was primarily to trees with some large trees snapped along the path.

LOVE COUNTY --- 2.2 SW MARIETTA [33.91, -97.14], 3.0 NNE LAKE MURRAY DAM [34.07, -97.04]

04/27/24 22:08 CST	1	0.15B	Tornado (EF4, L: 12.50 mi , W: 900 yd)
04/27/24 22:23 CST	6	0	Source: NWS Storm Survey

The Marietta-Lake Murray-Dickson tornado first produced damage near Peanut Road south of Indian Trails Road about two miles southwest of downtown Marietta. Trees and power poles were damaged near the beginning of the path and a house received some shingle damage . EF2 damage was observed as the tornado moved north-northeast and crossed Indian Trails Road where a home was unroofed and many trees were snapped .

As the tornado turned more northeast, it struck a Dollar Tree Distribution Center just west of Interstate 35 on the west side of Marietta causing significant roof and exterior wall damage to the facility. The company reported that the building and the inventory were not salvageable. A fatality occurred as the tornado crossed Interstate 35 just northeast of the distribution center and south of State Highway 32 as a southbound semi truck was overturned by the tornado. The driver was injured and the passenger was killed.

Just east of Interstate 35 along State Highway 32, the tornado destroyed a Dollar General store and a Homeland Grocery Store. NWS surveyors in coordination with a wind engineer rated the destruction of these two buildings as EF4. In this area, the tornado also caused significant damage to a truck stop, hospital and nursing home. The tornado continued north-northeast through the northwestern sections of Marietta continuing to produce tree, roof and power pole damage although damage intensity was not as strong as near State Highway 32.

After moving out of Marietta, the tornado turned northeast again snapping numerous trees and damaging a barn as it approached Lake Murray. The tornado crossed the southeastern portion of Lake Murray near the dam. It severely damaged a mobile home, destroyed a barn and snapped more trees after crossing the lake. The tornado then moved into Carter County near Scott Road.

Direct Fatalities: M53VE

MURRAY COUNTY --- 1.6 SE DOUGHERTY [34.38, -97.03], 3.2 NE DOUGHERTY [34.43, -97.00]

04/27/24 22:21 CST		2K	Tornado (EF1, L: 3.50 mi , W: 100 yd)

A tornado developed southeast of Dougherty and moved north -northeast likely dissipating as a waterspout over the southeast portion of Lake Of The Arbuckles. Tree damage was noted both along Big Canyon Road southeast of Dougherty near the beginning of the path , and along Goddard Youth Camp Road in the southern portion of the Chickasaw National Recreation area just south of Lake Of The Arbuckles .

CARTER COUNTY --- 8.7 SSW DICKSON [34.07, -97.04], 3.8 SE (ADM)ARDMORE APT [34.27, -96.97]

04/27/24 22:23 CST		1M	Tornado (EF2, L: 14.30 mi , W: 900 yd)
04/27/24 22:43 CST		0	Source: NWS Storm Survey

The Marietta-Lake Murray-Dickson Tornado moved from Love County into Carter County near Scott Road just east of Lake Murray . The tornado destroyed one mobile home, heavily damaged another and damaged many trees and power poles between the county line and where it crossed US Highway 70. The tornado turned north-northeast destroying one mobile home and damaging at least two others as it approached the town of Dickson. North of Dickson, at least one other home had significant roof damage and another mobile home was rolled in addition to continued tree and power pole damage. The tornado finally dissipated near US Highway 177 near the community of Baum.

MURRAY COUNTY --- 4.2 W HICKORY [34.56, -96.93], 2.7 NE SULPHUR [34.53, -96.93], 2.8 NE SULPHUR [34.53, -96.93], 4.1 W HICKORY [34.56, -96.93]

Heavy rainfall caused Wolf Creek to rise out of its banks, flooding a portion of Old Highway 70, west of Mannsville. Water entered at least residence along Old Highway 70. Event time is approximate.

A widespread, long-duration and historic severe weather and tornado outbreak occurred from the late morning through late evening on the 27th. In all, 32 tornadoes affected portions of the WFO Norman Forecast Area, the third most in a single day during the period of reliable record. This included six significant (EF-2+) tornadoes and one violent (EF-4) tornado that struck Marietta (Love County).

Synoptically, a slow-moving and deep mid/upper-level wave progressed across the Four Corners region during the day. At the surface, an area of low-pressure strengthened/deepened across southwest Kansas, with a trailing dryline extending near and just west of the 100th meridian through much of the day. As ascent overspread this feature, numerous (organized) severe thunderstorms developed across the WFO Norman Forecast Area, even by as early as daybreak/early morning hours. The boundary layer was characterized by strong instability and wind shear, favorable for an organized/supercell storm mode. Initial supercells across western Oklahoma produced a few reports of large hail and the first (brief) tornadoes of the event just after 10 AM. Supercell storm development continued across portions of the area, focusing along an axis from western-north Texas into north-central Oklahoma through much of the afternoon. The first significant (EF-2) tornado of the event impacted the eastern edge of Knox City (Knox County, Texas) just after 3 PM. Through the evening, a quasi-linear convective system (QLCS) organized and swept across much of southern/central Oklahoma and adjacent north Texas. Numerous mesovortex-type tornadoes developed and impacted the aforementioned areas. Ahead of the main convective line, strong warm air advection, driven by an increasing (45-60 knot) low-level jet, promoted the development of pre-frontal/line supercell thunderstorms. Multiple of these storms became strongly tornadic, producing multiple strong and long-tracking tornadoes. This included an EF-2 tornado impacting the western portions of Ardmore, an EF-3 tornado making a direct impact on the historic downtown district and adjacent neighborhoods in Sulphur, an EF-3 tornado traversing western portions of Hughes County, just west of Holdenville, and an EF-4 tornado destroying a Dollar Tree distribution center and nearby large retail stores on the western side of Marietta. The latter three tornadoes resulted in fatalities (1 in Sulphur, 2 near Holdenville and 1 in Marietta) along with additional injuries.

Beyond severe weather outcomes, a significant flash flooding event occurred from the late evening of the 27th through mid-morning of the 28th. The corridor of highest rainfall, with observed 24-hour totals of 5-to-8 inches, occurred across portions of south-central into southeast Oklahoma, on the heels of a cluster of significant tornado impacts earlier in the evening. Additional flooding occurred across far northern Oklahoma (Kay County) during the evening of the 27th.

Storm Data and Unusual Weather Phenomena - April 2024

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
MPing report.				
While the main 'piece' of an impactful upper wave lifted into the Northern Plains, a trailing cold front and highly unstable boundary layer fostered the development of a few thunderstorms during the evening of the 28th. While deep-layer wind shear was marginally sufficient (objective analysis showing ~30 knots), a few storms became transiently organized and produced a few reports of small hail.

	04/30/24 16:39 CST		0	Source: NWS Storm Survey
The Cordell Tornado developed about a mile south of Cordell along County Road E 1200 just west of US Highway 183. A couple of metal buildings were damaged along E1200 Road along with trees and power lines. Debris from these buildings were found about 300 yards north. The tornado moved north and northeast into Cordell near US-183 and Caddo Street and moving across the southern and eastern portions of Cordell causing roof damage for dozens of homes and a few businesses. The tornado dissipated soon after moving through a neighborhood on the northeast edge of Cordell.

	04/30/24 21:12 CST		0	Source: NWS Storm Survey
This tornado was first observed by a storm chaser at 932 pm CDT and likely formed near County Road E1830 just east of County Road N2320. Over the next 40 minutes, the tornado meandered slowly eastward along E1830 Road then turned northeast reaching near N2360 Road and E1820 Road. The tornado then turned and moved west-northwest along EW1820 Road finally dissipating near N2340 Road. The tornado occurred in a very rural area of Tillman County, although two farm homes were damaged near the easternmost point of the tornado path. A few barns were also damaged, otherwise the damage was primarily to trees and a few power poles.				
Although the damage is rated as EF1, velocity data from the nearby KFDR radar gives strong indication that the tornado may have been much stronger than observed damage would indicate. The maximum observed rotational velocity from KFDR reached 114 knots.

Storm Data and Unusual Weather Phenomena - April 2024

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
TILLMAN COUNTY --- 2.1 SSE LOVELAND [34.27, -98.75], 2.6 WNW GRANDFIELD [34.25, -98.73]				
	04/30/24 21:18 CST		2K	Tornado (EF1, L: 2.15 mi , W: 200 yd)
	04/30/24 21:32 CST		0	Source: NWS Storm Survey
A strong anticyclonic tornado developed between Loveland and Grandfield near the intersection of county roads E 1890 and N2370 Roads. Trees were snapped near the beginning of the path, but no other damage was observed or accessible in this very rural area of Tillman County and the remainder of the path is estimated from differences in NDVI satellite imagery . As with the tornado northeast of Hollister, velocity data from nearby KFDR radar indicates that this tornado was likely stronger than the observed damage indicates with the rotational velocity observed from KFDR up to 71 knots.

Ringling (RING) Mesonet observation.				
A rather nebulous upper air pattern existed across the Southern Plains on the 30th, with 30-40 knots of quasi-zonal flow at 500 mb. However, plentiful solar insolation/surface heating in the vicinity of a dryline fostered widely scattered thunderstorm development by the late afternoon. Strong instability and sufficient organizing wind shear lead to a few of these storms displaying supercellular				

Storm Data and Unusual Weather Phenomena - April 2024

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
characteristics and producing reports of large hail initially, owing to steep lapse rates and weak low-level shear (among other factors already mentioned). By the mid-evening, as low-level shear and storm-scale interactions began to increase, a few tornadoes occurred across portions of south-central into southwest Oklahoma. The most significant of these was an EF-1 tornado near the community of Hollister (Tillman County).				
TEXAS, Western North				
FOARD COUNTY --- THALIA [33.98, -99.54]				
	04/01/24 15:45 CST	0		Hail (1.50 in)
	04/01/24 15:45 CST	0		Source: Public
A strong (90-100 knot) mid-level speed maximum, embedded within a broader longwave trough (at 500 mb), approached portions of the area during the afternoon into the evening on the 1st. As strong synoptic ascent overspread a boundary layer characterized by seasonable moisture (ahead of an approaching cold front), multiple rounds of convection developed and impacted portions of the WFO Norman Forecast Area. Despite strong instability and organizing wind shear, early-day clouds and areas of precipitation hampered destabilization in the boundary layer. This facilitated a predominately 'elevated' character of convection, with a few instances of large hail resulting from the strongest storms. The approaching cold front also acted to "undercut" established storms in its vicinity, limiting concern for tornadic outcomes (despite increasing low-level shear towards dusk).				
WICHITA COUNTY --- 3.8 S WICHITA FALLS [33.86, -98.48]				
	04/06/24 16:40 CST	0		Hail (0.75 in)
	04/06/24 16:40 CST	0		Source: Public
MPing report.				
A vigorous shortwave trough quickly moved into portions of the Central/Southern Plains during the day on the 6th. Hazardous weather occurred on both sides of an advancing Pacific front/dryline during the afternoon and evening hours. In the moist sector, widely scattered thunderstorm development occurred during the late afternoon. Despite strong deep-layer wind shear (as expected with a strong upper wave), limited instability proved hostile for sustained severe convection/outcomes. A few storms produced small hail across portions of western-north Texas.				
KNOX COUNTY --- 3.5 N KNOX CITY [33.47, -99.81]				
	04/08/24 20:30 CST	2K		Thunderstorm Wind (EG 52 kt)
	04/08/24 20:30 CST	0		Source: Emergency Manager
Powerlines reported down along Texas Highway 6. Based on radar analysis, a probable downburst wind event ahead of a nearby thunderstorm. Time is radar estimated.				
Broad southwesterly mid-level flow prevailed across the Southern Plains on the 8th. Widespread thunderstorm development occurred in the vicinity of a quasi-stationary boundary across west-central into north-central Texas during the evening hours. A few storms encroached on far southern portions of the WFO Norman Forecast Area, with a few instances of large hail and a downburst wind event occurring across portions of the Red River Valley.

Report relayed by emergency management.				
A strong synoptic wave approached the region during the evening into overnight hours on the 15th. An initial round of convection (during the afternoon of the 15th) preceded the more prominent mid/upper trough. This activity was driven in part by warm-air advection processes and synoptic support from a phasing branch on the subtropical jet. Sufficient instability and organizing wind shear promoted organized (supercell) thunderstorms with a threat of large hail. Through the evening, despite continued strong wind shear and approaching (increasing) synoptic ascent, a prominent layer of warm air aloft ('cap') prevented robust storm development through sunset. Scattered convection did ultimately develop by the very late evening on the 15th. However, outside of a severe-caliber wind gust along the Oklahoma/Kansas border area, severe weather outcomes were limited until convection moved north of the WFO Norman area (into south-central Kansas).

	04/27/24 14:40 CST		0	Source: NWS Storm Survey
This tornado developed just southwest of Knox City and initially moved eastward across the south side of town, then turned northeast moving through the east side of town. A few houses suffered roof damage, and some sheds, outbuildings and trees were significantly damaged in Knox City. As the tornado continued to move northeast through rural Knox County, a few more farm houses had roof damage, barns were significantly damaged. A number of power poles along FM-2534 were broken. The tornado finally dissipated about 2 miles west of Rhineland.

A tornado was observed by storm chasers and research meteorologists . The tornado initially developed in northern Wichita County and damaged a couple of power poles along Thrift Road to the north-northwest of Burkburnett. The tornado moved east-northeast crossing the Red River into far southeastern Tillman County Oklahoma.

	MPing report.			

A widespread, long-duration and historic severe weather and tornado outbreak occurred from the late morning through late evening on the 27th. In all, 32 tornadoes affected portions of the WFO Norman Forecast Area, the third most in a single day during the period of reliable record. This included six significant (EF-2+) tornadoes and one violent (EF-4) tornado that struck Marietta (Love County).

Synoptically, a slow-moving and deep mid/upper-level wave progressed across the Four Corners region during the day. At the surface, an area of low-pressure strengthened/deepened across southwest Kansas, with a trailing dryline extending near and just west of the 100th meridian through much of the day. As ascent overspread this feature, numerous (organized) severe thunderstorms developed across the WFO Norman Forecast Area, even by as early as daybreak/early morning hours. The boundary layer was characterized by strong instability and wind shear, favorable for an organized/supercell storm mode. Initial supercells across western Oklahoma produced a few reports of large hail and the first (brief) tornadoes of the event just after 10 AM. Supercell storm development continued across portions of the area, focusing along an axis from western-north Texas into north-central Oklahoma through much of the afternoon. The first significant (EF-2) tornado of the event impacted the eastern edge of Knox City (Knox County, Texas) just after 3 PM. Through the evening, a quasi-linear convective system (QLCS) organized and swept across much of southern/central Oklahoma and adjacent north Texas. Numerous mesovortex-type tornadoes developed and impacted the aforementioned areas. Ahead of the main convective line, strong warm air advection, driven by an increasing (45-60 knot) low-level jet, promoted the development of pre-frontal/line supercell thunderstorms. Multiple of these storms became strongly tornadic, producing multiple strong and long-tracking tornadoes. This included an EF-2 tornado impacting the western portions of Ardmore, an EF-3 tornado making a direct impact on the historic downtown district and adjacent neighborhoods in Sulphur, an EF-3 tornado traversing western portions of Hughes County, just west of Holdenville, and an EF-4 tornado destroying a Dollar Tree distribution center and nearby large retail stores on the west side of Marietta. The latter three tornadoes resulted in fatalities (1 in Sulphur, 2 near Holdenville and 1 in Marietta) along with additional injuries.

Beyond severe weather outcomes, a significant flash flooding event occurred from the late evening of the 27th through mid-morning of the 28th. The corridor of highest rainfall, with observed 24-hour totals of 5-to-8 inches, occurred across portions of south-central into

Storm Data and Unusual Weather Phenomena - April 2024

southeast Oklahoma, on the heels of a cluster of significant tornado impacts earlier in the evening. Additional flooding occurred across far northern Oklahoma (Kay County) during the evening of the 27th.				
FOARD COUNTY --- 2.3 SSE THALIA [33.95, -99.53]				
	04/30/24 17:33 CST		0	Hail (1.00 in)
	04/30/24 17:33 CST		0	Source: Public

MPing report.

A rather nebulous upper air pattern existed across the Southern Plains on the 30th, with 30-40 knots of quasi-zonal flow at 500 mb. However, plentiful solar insolation/surface heating in the vicinity of a dryline fostered widely scattered thunderstorm development by the late afternoon. Strong instability and sufficient organizing wind shear lead to a few of these storms displaying supercellular characteristics and producing reports of large hail initially, owing to steep lapse rates and weak low-level shear (among other factors already mentioned).
