A cluster of thunderstorms was ongoing across southwestern Oklahoma and north Texas around daybreak on the 2nd. This activity was fostered by a nocturnal low-level jet across the region. As surface insolation began (i.e., instability increase), additional thunderstorm development continued from the areas mentioned above into portions of central/south-central Oklahoma. Hail and damaging wind gusts were observed with the strongest thunderstorms within the broader complex. By the late evening, decaying supercell thunderstorms across the eastern Texas Panhandle produced a downburst wind gust across Beckham County, Oklahoma.

Chandler (CHAN) Mesonet observation.

Multiple rounds of severe weather produced reports of thunderstorm wind, large hail and flash flooding across central into southern Oklahoma on the 4th into the early morning hours of the 5th. The first convective episode began just after midnight on the 4th when a (strong) warm air advection pattern commenced across central into southern Oklahoma. Initial activity slowly organized into a line of storms, progressing across central and southern Oklahoma. Reports of small hail and thunderstorm wind damage occurred. Localized heavy rainfall from the southern Oklahoma City Metropolitan area into southeast Oklahoma also fostered flash flooding. A briefly organized thunderstorm occurred behind this complex (across the Oklahoma City Metropolitan area) and produced a few reports of large hail towards sunrise. By the evening, a second round of organized convection developed across the eastern two-thirds of Oklahoma, fostered by the approach of a more substantial upper wave (i.e., increased deep-layer wind shear combined with continued strong instability). Additional damaging wind and large hail reports were observed with this round, along with renewed concern for localized flash flooding, especially across the southern suburbs of the Oklahoma City Metropolitan area.

Heavy rainfall caused Sand Creek and Rock Creek to rise out of their banks, flooding roadways in and around the community of Ravia. Roadways experiencing flooding included: Pine Creek Road, Slippery Falls Road, South Dexter Road, McSwain Lane and Fuller Lane, with portions of the two latter locations washed out. Event time is approximate.

CARTER COUNTY --- 3.5 ESE LONE GROVE [34.17, -97.20]

An organized linear complex of thunderstorms, centered across south-central Kansas, produced a severe-caliber wind gust across far northern Oklahoma during the early morning of the 9th. Additional diurnally-driven convection across southern Oklahoma produced localized flooding and a report of large hail during the evening.

Blackwell (BLAC) Mesonet observation.

Scattered thunderstorms developed near a surface front across northern Oklahoma during the early evening of the 29th. Sufficient deep-layer wind shear and instability promoted an environment capable of transiently organized thunderstorms. A few such storms developed across north-central Oklahoma, producing reports of large hail and damaging winds.

Relayed images showing tree limbs blown down and a portable outbuilding overturned near the intersection of Southwest Parkway and Barnett Road. Time is radar estimated.

A cluster of thunderstorms was ongoing across southwestern Oklahoma and north Texas around daybreak on the 2nd. This activity was fostered by a nocturnal low-level jet across the region. As surface insolation began (i.e., instability increase), additional thunderstorm development continued in areas near the Red River. One of these thunderstorms produced a damaging wind gust event near the Wichita Falls Metropolitan area.
