Average Date:

Background: The table above was developed for major cities across the state of Kentucky based on the 1981-2010 Climate Normals. This information can assist in knowing when to plant or harvest various crops, fruit, or vegetables across the Bluegrass State. The probability level is used in a way that 90%, 50%, or 10% displays the chance that the threshold temperature will occur before the respective date. 50% can be seen as the average date that each temperature is met for the first time. Also included are the earliest and latest dates that a particular threshold temperature has occurred at each location over the time-span.
